

The failure of the 2021 FMCO in Penang

David Benjamin Lim, Stanford Ph.D. '20 (Mathematics)

August 25, 2021

Overview

“Averages are dangerous in the absence of equidistribution.”

Why are averages dangerous?

Example:

Why are averages dangerous?

Example:

- Ali, Ah Beng and Muthu are each worth RM50,000. The average net worth of the three of them:

Why are averages dangerous?

Example:

- Ali, Ah Beng and Muthu are each worth RM50,000. The average net worth of the three of them:

$$\text{RM } \frac{50,000 + 50,000 + 50,000}{3} = \text{RM } 50,000.$$

Why are averages dangerous?

Example:

- Ali, Ah Beng and Muthu are each worth RM50,000. The average net worth of the three of them:

$$\text{RM } \frac{50,000 + 50,000 + 50,000}{3} = \text{RM } 50,000.$$

- Now let's add Robert Kuok. His net worth is \approx RM 40 billion. The average net worth of Ali, Ah Beng, Muthu and Robert Kuok is:

Why are averages dangerous?

Example:

- Ali, Ah Beng and Muthu are each worth RM50,000. The average net worth of the three of them:

$$\text{RM } \frac{50,000 + 50,000 + 50,000}{3} = \text{RM } 50,000.$$

- Now let's add Robert Kuok. His net worth is \approx RM 40 billion. The average net worth of Ali, Ah Beng, Muthu and Robert Kuok is:

$$\text{RM } \frac{50,000 + 50,000 + 50,000 + 40 \text{ billion}}{4} \approx \text{RM } 10 \text{ billion}.$$

Moral of the Story?

When we have extreme outliers, the average is a bad measure.

The basic reproductive number R_0

The basic reproductive number R_0

- The R_0 is the **average** number of people that someone with COVID-19 will infect.

The basic reproductive number R_0

- The R_0 is the **average** number of people that someone with COVID-19 will infect.
- It is a measure of how fast COVID-19 is spreading.

The basic reproductive number R_0

- The R_0 is the **average** number of people that someone with COVID-19 will infect.
- It is a measure of how fast COVID-19 is spreading.
- $R_0 > 1$ means growth, $R_0 < 1$ means decay.

The basic reproductive number R_0

- The R_0 is the **average** number of people that someone with COVID-19 will infect.
- It is a measure of how fast COVID-19 is spreading.
- $R_0 > 1$ means growth, $R_0 < 1$ means decay.
- R_0 for COVID-19 is about 1 – 3 (or 5 – 8 for delta).

The basic reproductive number of workplaces

- R_0 of someone that started a workplace cluster?

The basic reproductive number of workplaces

- R_0 of someone that started a workplace cluster?
- Average size of workplace cluster in Penang: 100 people

The basic reproductive number of workplaces

- R_0 of someone that started a workplace cluster?
- Average size of workplace cluster in Penang: 100 people
- If 4 people started this cluster, then each person spread covid to $100/4 = 25$.

The basic reproductive number of workplaces

- R_0 of someone that started a workplace cluster?
- Average size of workplace cluster in Penang: 100 people
- If 4 people started this cluster, then each person spread covid to $100/4 = 25$.
- R_0 of someone that started a workplace cluster = 25.

The basic reproductive number of workplaces

- R_0 of someone that started a workplace cluster?
- Average size of workplace cluster in Penang: 100 people
- If 4 people started this cluster, then each person spread covid to $100/4 = 25$.
- R_0 of someone that started a workplace cluster = 25.
- 25?

The basic reproductive number of workplaces

- R_0 of someone that started a workplace cluster?
- Average size of workplace cluster in Penang: 100 people
- If 4 people started this cluster, then each person spread covid to $100/4 = 25$.
- R_0 of someone that started a workplace cluster = 25.
- 25? Yes, **TWENTY FIVE, DUA PULUH LIMA!**

- Upshot: R_0 of someone that started a workplace cluster is **MUCH BIGGER** than a random person with covid.

- Upshot: R_0 of someone that started a workplace cluster is **MUCH BIGGER** than a random person with covid.
- How much did workplace clusters contribute to the R_0 of Penang?

- Upshot: R_0 of someone that started a workplace cluster is **MUCH BIGGER** than a random person with covid.
- How much did workplace clusters contribute to the R_0 of Penang?
- For 1/6/2021 - 14/7/2021 (First 6 weeks of FMCO):

- Upshot: R_0 of someone that started a workplace cluster is **MUCH BIGGER** than a random person with covid.
- How much did workplace clusters contribute to the R_0 of Penang?
- For 1/6/2021 - 14/7/2021 (First 6 weeks of FMCO):

R_0 of Penang	0.958
-----------------	-------

- Upshot: R_0 of someone that started a workplace cluster is **MUCH BIGGER** than a random person with covid.
- How much did workplace clusters contribute to the R_0 of Penang?
- For 1/6/2021 - 14/7/2021 (First 6 weeks of FMCO):

R_0 of Penang	0.958
Contribution from workplace clusters	0.715

- Upshot: R_0 of someone that started a workplace cluster is **MUCH BIGGER** than a random person with covid.
- How much did workplace clusters contribute to the R_0 of Penang?
- For 1/6/2021 - 14/7/2021 (First 6 weeks of FMCO):

R_0 of Penang	0.958
Contribution from workplace clusters	0.715
Residual	0.244

(Continued)

- Similar conclusions can be drawn for 1/7/2021 - 1/8/2021:

- Similar conclusions can be drawn for 1/7/2021 - 1/8/2021:

R_0 of Penang	1.218
Contribution from workplace clusters	0.686
Residual	0.536

- Similar conclusions can be drawn for 1/7/2021 - 1/8/2021:

R_0 of Penang	1.218
Contribution from workplace clusters	0.686
Residual	0.536

- Total cases** from workplaces = 40%, but their contribution to the R_0 is **huge!**

- Similar conclusions can be drawn for 1/7/2021 - 1/8/2021:

R_0 of Penang	1.218
Contribution from workplace clusters	0.686
Residual	0.536

- Total cases** from workplaces = 40%, but their contribution to the R_0 is **huge**!
- A small subset of cases can be the cause of most of your problems.

What do these results mean?

What do these results mean?

Punchline: If there were no workplace clusters in the first 6 weeks of lockdown, can make **very strong** argument that COVID-19 would have decreased **tremendously** in Penang.

Other places

- Gyms, sports facilities, movie theatres, etc?

- Gyms, sports facilities, movie theatres, etc?
- Can a similar analysis be done as in the case of workplaces?

Small detour: Priority Fitness Penang

Figure: 3rd rep of 125kg on the deadlift

- Workplaces (Factories, construction sites, etc) are the root cause of the problem, but we bend over backwards for them to stay open **at all costs**.

- Workplaces (Factories, construction sites, etc) are the root cause of the problem, but we bend over backwards for them to stay open **at all costs**.
- But we do not allow gyms, sports facilities, movies, etc to open, not even for those fully vaccinated!

“Those who mistake the unessential to be essential and the essential to be unessential, dwelling in wrong thoughts, never arrive at the essential.” (Dhammapada, Chapter 1:11)

Thank you. And I'll take any questions from here.
